

Forklift Fork Positioner

Fork Positioner for Forklifts - The fork positioner is a hydraulic device that allows the person driving to be able to control the lift truck without leaving the seat. They are made out of top quality materials and are designed to endure the most demanding procedures and work environments. Side shifting units have the extra ability to laterally position the arms or the entire load so as to facilitate much more precise lifting and placement in a quicker and much more efficient method.

The only one of its kind fork pocket design could enable the individual operating it to safely sway the unit's forks without any worry of destroying the positioning cylinders. This can allow the operator the choice to either execute independent or simultaneous blade movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are required. Standard OEM carriages could be converted into fork positioners on available units.
